

Visual Processing

Do you see what I see?

Aphantasia

Close your eyes

- Can you imagine an apple?
- What does it look like?
- Can you smell it?
- Could you taste it?

Composition by Belbury, original image components by Mrr cartman, Caduser2003, Bernt Fransson and [IconArchive.com](https://www.iconarchive.com) CC BY-SA 4.0

Aphantasia

It's not just vision

- Some people can imagine and remember sound
- Some people can imagine and remember smells, taste, and touch

Prosopagnosia

Not everyone can remember faces

Social Perception Lab Tests

Below is a list of test types that we share with other researchers and clinicians. Please click on the corresponding category for individual test details. Many of these tests can be requested from Testable.org via the Testable Library. In the test details, asterisks next to the name indicate the test is in the Testable Library. Testable.org is a platform for online and offline behavioral testing that we like a lot, but if you'd prefer to run your tests on other platforms, you can download the stimuli and script for a test and set it up yourself.

If you're interested in a test that we created that's not listed here, please email Brad Duchaine (bradley.c.duchaine@dartmouth.edu).

+ Follow

1. Standard pre-conference apology: I'm terrible at faces, names, placing names once I hear them, and if I do it to you, feel free to blame me and think bad things about me. I'm sorry. I promise it's not personal, though; I've stared right past close friends.

Sep 4, 2024 at 8:27 AM  Everybody can reply

“Being a super recognizer isn't all upside, says Josh Davis, a psychology professor at the University of Greenwich. Pretty often super recognizers will recognize a person whom they really shouldn't know-for instance, the younger sister of their fifth-grade best friend. In these cases, they feel compelled to pretend they haven't recognized that person. “They don't want to seem creepy, or like a stalker.””

SDAM

Severely Deficient Autobiographical Memory

- Episodic memory
- Semantic memory

“[...] There is some evidence that faces act as a node for other biographical information-like where someone grew up and what they studied in college. Things like that might be hard to retrieve if you can't recall someone's face.” This is fantastic news. Having a neurological disorder is much better than being an asshole.’

Sadie Dingfelder, Do I Know You?

RIPE

Meetings mean meeting

- Every IP address is unique but only slightly
- Large print names on badges are really helpful!
- I might rely on your glasses or some other relatively stable item to augment my limited memory
